Note B: baseline and robustness results

Unemployment and prices after a monetary policy surprise

Generated by `baseline/07_report.py`

Specification

Each number is the response of the unemployment gap (percentage points) or the core PCE price *level* (percent) to a monetary policy surprise that raises the 2-year Treasury yield by 1 percentage point in the announcement window, 12, 24 and 36 months later. Responses are traced through a daily block (the 2-year yield and, where included, the market financial conditions index (FCI) of Note A) into a monthly system for the unemployment gap and core PCE inflation. **Main tables use 12 monthly lags, fixed in advance; the appendix shows 3, 6 and 12.** The surprises are the Nakamura–Steinsson policy news series (252 FOMC announcements, January 1996 to July 2026), identified in the announcement window with macro variables held fixed. Macro variables come first within the month. No deterministic trend is included except in Robustness 2c–d. The sample runs to September 2026 unless stated. Intervals are 90% bootstrap intervals from 200 draws (resampling announcements and monthly residuals; the daily block is not re-estimated). A star marks a 90% interval that excludes zero. Without the FCI the daily block contains the 2-year yield alone; with it, the FCI is in the same form (nominal, real or r*-gap) as the 2-year yield.

1 Baseline

Table 1: Baseline: 1996 to the present, all data in, no trend (12 lags)

				Unemployment gap (pp)			Price level (%)		
Case	FCI	Lags	Obs	12 m	24 m	36 m	12 m	24 m	36 m
Nominal	none	12	369	−0.84*	−0.46*	−0.25	0.09	0.01	−0.13
				[−1.27, −0.39]	[−0.76, −0.13]	[−0.60, 0.10]	[−0.11, 0.34]	[−0.37, 0.45]	[−0.70, 0.51]
	nominal	12	369	−0.01	0.30	0.38*	−0.15	−0.49*	−0.82*

r*-gap	none	12	369	−0.28	−0.06	0.04	−0.22*	−0.44*	−0.68*
				[−0.91, 0.18]	[−0.68, 0.31]	[−0.56, 0.47]	[−0.40, −0.01]	[−0.82, −0.03]	[−1.34, −0.07]
	r*-gap	12	369	0.33	0.50*	0.43*	−0.41*	−0.78*	−1.06*
				[−0.17, 0.67]	[0.12, 0.76]	[0.10, 0.70]	[−0.59, −0.19]	[−1.25, −0.35]	[−1.90, −0.32]

Nominal, real and r*-gap 2-year yield; the FCI is Note A's index in the matching form in each case. Per +1 pp on the 2-year yield. * = 90% interval excludes zero; intervals in brackets. Obs = monthly observations in the equations.

Figure 1: Baseline: the three steps, without and with the FCI

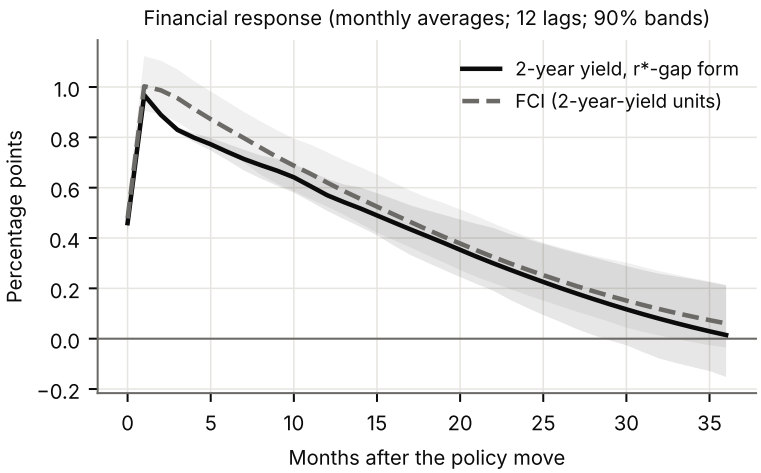

Figure 2: The financial response behind the baseline

Table 2: Market-index weights from policy news

Component	Response to policy news	Weight	Share of a policy move
10-year Treasury yield (pp)	+0.53 (0.06)	+0.609	0.33
Equity valuation, 100 ln CAPE (%)	−7.78 (0.93)	−0.051	0.40
Real broad dollar, 100 ln (%)	+4.22 (0.53)	+0.065	0.28

Response of each 30-minute announcement-window change to the policy-news factor (scaled so the 2-year yield moves 1 pp), with robust standard errors; weights from the one-factor GLS of Note A; share = weight × response (the three shares sum to 1).

Table 3: Implied trade-off: Phillips multiplier κ_H (12 lags)

Case	FCI	$H = 24$ months	$H = 36$ months
Nominal	none	−0.01 [−0.31, 0.42]	0.08 [−0.25, 0.66]
	nominal	unbounded	unbounded
Real	none	0.14 [−0.24, 1.37]	0.21 [−0.22, 3.19]
	real	unbounded	unbounded
r*-gap	none	unbounded	unbounded
	r*-gap	−1.06 [−6.84, −0.40]	−0.88 [−3.34, −0.27]
Start 1973	r*-gap	−2.16 [−27.06, −1.20]	−2.19 [−29.88, −1.29]
2020 dropped	r*-gap	−0.95 [−1.83, −0.38]	−0.80 [−1.74, −0.27]
2020 dropped, start 1973	r*-gap	−1.47 [−2.50, −0.89]	−1.59 [−2.84, −0.90]
Ends 2019	r*-gap	−0.35 [−1.23, 0.15]	−0.38 [−2.98, 0.12]
Ends 2019, start 1973	r*-gap	−1.03 [−1.87, −0.48]	−1.25 [−2.42, −0.67]
r*-gap minus nominal, with FCI		[−1.57, 6.37]	[−0.89, 4.05]

κ_H = core PCE price level at month H (percent) per percentage-point year of cumulative unemployment-gap response (Barnichon and Mesters 2021); the sacrifice ratio is $-1/\kappa_H$. Point estimate and 90% confidence set (Anderson–Rubin type) in brackets, computed exactly (a wide grid refined by bisection), so a finite end is never an artifact of the grid. An infinite end means that the 90% interval of the cumulative unemployment response includes zero: the data then cannot rule out arbitrarily steep trade-offs on that side; "unbounded": both sides. Last row: paired difference over common announcement draws.

1.1 Monthly VAR benchmark

The baseline traces a surprise through a daily block. The benchmark in most of the literature is a purely monthly VAR. We estimate it on the same announcements, for the baseline sample (from 1996) and for a long sample (from 1973),

$$y_t = c + \sum_{l=1}^{L} A_l\, y_{t-l} + u_t, \qquad y_t = (\text{unemployment gap},\ \text{core PCE inflation},\ i_t\,[,\ F_t])', \tag{1}$$

with i_t the monthly-average 2-year yield and F_t the FCI in the same step. Responses to a unit shock with impact vector s are $\Theta_h s$, where Θ_h are the moving-average matrices of (1). Two ways of choosing s:

- **Proxy VAR** (Stock and Watson 2018; Mertens and Ravn 2013; Gertler and Karadi 2015; with high-frequency surprises, Bauer and Swanson 2023). The instrument z_t is the Nakamura–Steinsson surprise (Nakamura and Steinsson 2018) summed over the announcements in month t. Assumptions: relevance, $E[z_t \varepsilon_t^{mp}] \neq 0$, and exogeneity, $E[z_t \varepsilon_t^{o}] = 0$ for the other shocks. Then $s_j/s_i = E[z_t u_{jt}]/E[z_t u_{it}]$, estimated by regressing each residual on z_t; every entry of s, including unemployment and inflation, is estimated. Inference: the 90% Anderson–Rubin set $\{\theta :\ \hat{b}(\theta)^2/\hat{V}(\theta) \leq \chi^2_{1,0.90}\}$ for the response of a target (conditional on the VAR coefficients, HC1

variance), a quadratic inequality in θ solved exactly (Montiel Olea, Stock and Watson 2021; Lunsford 2015).

- **Window impact.** $s = \phi\,(0, 0, 1, b_F)'$: the impact on the 2-year yield and the FCI is measured in the announcement window, the macro entries are zero, and ϕ is the average share of the month that follows the announcement. The assumption, as in the main model, is that the shock reaches unemployment and inflation only through the 2-year yield and the FCI. Inference: bootstrap.

The two units differ (monthly-average versus window 2-year). Plagborg-Møller and Wolf (2021) show that VARs and local projections estimate the same responses; the difference here is the temporal aggregation of a surprise that is concentrated on one day.

Table 4: Monthly VAR benchmark, 1996 sample (12 lags)

					Unemployment gap (pp)			Price level (%)

Monthly VAR in the unemployment gap, core PCE inflation, the 2-year yield and, when included, the FCI (same step), sample as in the title, to September 2026, no trend, nothing dropped. Proxy VAR: Nakamura–Steinsson surprise as instrument; sets are exact 90% Anderson–Rubin sets, "unbounded" when the instrument cannot reject large effects; unit +1 pp on the monthly-average 2-year yield. Window impact: impact vector measured in the announcement window and scaled by the share of the month after the announcement; 90% bootstrap intervals; unit +1 pp 2-year in the window. The two units differ. * = 90% interval excludes zero.

		r*-gap	7.3	6.5	3.5	0.45	0.99
1973	Nominal	none	7.2	6.0	5.5		
		nominal	2.3	1.2	0.8	0.42	0.99
	Real	none	6.7	5.0	4.6		
		real	1.8	0.7	0.8	0.24	0.99
	r*-gap	none	6.6	5.6	5.0		
		r*-gap	1.6	0.7	0.9	0.63	0.99

F: robust first-stage statistic of the policy-variable residual on the instrument (instrument months only). The instrument exists from 1996, so the first stage uses the 1996–2026 instrument months in both samples. Impact on FCI: response of the FCI per +1 pp on the 2-year yield, estimated from monthly residuals (proxy VAR, 12 lags) and measured in the announcement window.

1.2 Would a monthly proxy VAR look like the data if the model were true?

The proxy VAR is weak in the data (first-stage F of 2 to 6) and, without the FCI, gives a falling unemployment rate. Is that what the estimated model implies for a monthly estimator? We use the estimated r*-gap model of Section 1, the paper's baseline, as the one true process: the daily block $f_d = B'x_d + \varepsilon_d + b\, s_j \mathbf{1}[d \in \text{announcement } j]$ and the monthly equations, with the data's calendar (369 months) and announcement days, bootstrapped innovations and surprises s_j drawn from the observed Nakamura–Steinsson surprises. Policy therefore reaches unemployment and inflation only through the 2-year yield and the FCI. On each of 1,000 simulated samples we estimate the monthly proxy VAR with and without the FCI and the window-impact version, exactly as in the data, and compare the distribution of the statistics with the data. The true values are the model's own responses, converted to the monthly-average unit of the proxy VAR as the ratio of averages (an approximation). The table first shows the data analysed with r*-gap measures. If the r*-gap model is true, a researcher who measures the 2-year yield and the FCI in nominal or real form observes the r*-gap series plus slow-moving terms (expected inflation and r*, and the corresponding terms of the index) that do not depend on the policy shock; the appendix repeats the exercise with those measures, with the same true responses, and compares with the nominal and real data.

Table 7: Would a monthly proxy VAR look like the data if the r*-gap model were true? r*-gap measures

Quantity	Data	True	Simulated median	5th–95th	Share ≤ data
A. Proxy VAR without the FCI					
First-stage F	5.7		3.4	[0.1, 13.7]	0.67
Unemployment, 12 m	−0.47	0.72	−0.02	[−1.66, 1.85]	0.26
Unemployment, 12 m: set unbounded	no				0.44
Price level, 24 m	−0.89	−1.70	−0.66	[−3.15, 1.78]	0.41
Price level, 24 m: set unbounded	no				0.44
Unemployment, 12 m: estimate negative	yes				0.51
Unemployment, 12 m: set bounded and below zero	no				0.05
B. Proxy VAR with the FCI					
First-stage F	3.5		3.3	[0.1, 13.2]	0.53
Unemployment, 12 m	−0.06	0.72	0.34	[−1.34, 3.27]	0.28
Unemployment, 12 m: set unbounded	no				0.45
Price level, 24 m	−1.30	−1.70	−0.83	[−4.34, 1.34]	0.33
Price level, 24 m: set unbounded	no				0.45
Impact on the FCI per +1 pp 2-year	0.45	1.04	1.01	[−0.49, 3.30]	0.19
C. Monthly VAR with the window impact					
Unemployment, 12 m (window units)	0.15	0.33	0.16	[−0.10, 0.44]	0.49
Price level, 24 m (window units)	−0.37	−0.78	−0.40	[−0.67, −0.13]	0.58

1,000 samples of 369 months generated by the estimated r*-gap model with the FCI (12 lags) as the true process, with the data's calendar and announcement days; proxy VAR with 12 lags. Data: the 1996 sample, 12 lags, in the same form. True: the r*-gap model's response per +1 pp on the monthly-average 2-year yield (ratio of the window response to its contemporaneous monthly-average response), or per +1 pp in the window in panel C. For yes/no rows the last column is the simulated frequency of the event. A data value near the middle of the simulated distribution (share close to 0.5) means the data look like a typical sample from the model.

1.3 The same test for the paper's own estimator

The same simulated samples can be used to ask whether the nominal and real results of Section 1 are what the r*-gap model implies. On each sample we re-estimate the full daily-block model, with the 2-year yield and the FCI measured in r*-gap, nominal and real form, and record the responses of unemployment and the price level after 12 and 24 months. The r*-gap estimates are centred on the true responses, so the estimator is approximately unbiased. With the FCI, the nominal and real data

estimates lie inside the simulated bands. Without the FCI, the data estimates of the unemployment response with nominal and real measures lie below the simulated bands: the r*-gap model with mismeasured rates does not by itself generate a response that negative.

Table 8: The daily-block model on samples simulated from the r*-gap model: data estimates and simulated distributions (12 lags)

		r*-gap measures		Nominal measures		Real measures	
Response	True	Data	Simulated	Data	Simulated	Data	Simulated
A. 2-year yield and FCI

			[−0.92, −0.11]		[−0.72, 0.09]		[−0.80, 0.00]

1,000 samples of 369 months generated by the estimated r*-gap model with the FCI. On each sample the full model (daily HAR block and monthly equations, 12 lags, no trend) is re-estimated with the 2-year yield (and the FCI) measured in the stated form; nominal and real measures are the r*-gap series plus the actual expected-inflation and r* terms. Responses per +1 pp on the 2-year yield in the announcement window. True: the r*-gap model's responses, which equal the r*-gap data estimates by construction. Simulated: median and 5th–95th percentiles. †: the data estimate lies outside the simulated 90% band.

2 Robustness

Table 9: Robustness 1: sample (r*-gap 2-year yield and FCI) (12 lags)

Kiley r*: 2-year minus expected inflation minus Kiley's r*, with Note A's index built with the same r*. Real, spline trend: real 2-year and real FCI with a natural cubic spline trend (knots at the sample ends and at NBER business-cycle peaks inside the sample) in every monthly equation, in place of any r* measure. Per +1 pp on the 2-year yield. * = 90% interval excludes zero; intervals in brackets. Obs = monthly observations in the equations.

Table 11: Robustness 3: excess bond premium (r*-gap) (12 lags)

r*-gap. Monthly system u, inflation, EBP (EBP treated like u and inflation; responses shown for u and the price level). Per +1 pp on the 2-year yield. * = 90% interval excludes zero; intervals in brackets. Obs = monthly observations in the equations.

Table 23: Robustness 3b: excess bond premium as a third monthly variable, start 1973

Table 26: Would a monthly proxy VAR look like the data if the r*-gap model were true? Nominal measures

Quantity	Data	True	Simulated median	5th–95th	Share ≤ data
A. Proxy VAR without the FCI					
First-stage F	5.2		2.2	[0.0, 10.4]	0.77
Unemployment, 12 m	−1.27	0.72	−0.04	[−2.14, 2.20]	0.10
Unemployment, 12 m: set unbounded	no				0.57
Price level, 24 m	−0.07	−1.70	−0.30	[−3.70, 2.77]	0.60
Price level, 24 m: set unbounded	no				0.57
Unemployment, 12 m: estimate negative	yes				0.52
Unemployment, 12 m: set bounded and below zero	yes				0.04
B. Proxy VAR with the FCI					
First-stage F	1.9		2.1	[0.0, 10.3]	0.47
Unemployment, 12 m	−0.87	0.72	0.25	[−1.94, 3.89]	0.10
Unemployment, 12 m: set unbounded	yes				0.58
Price level, 24 m	−0.47	−1.70	−0.40	[−4.48, 2.18]	0.47
Price level, 24 m: set unbounded	yes				0.58
Impact on the FCI per +1 pp 2-year	0.10	1.04	0.92	[−1.58, 4.06]	0.14
C. Monthly VAR with the window impact					
Unemployment, 12 m (window units)	−0.16	0.33	0.15	[−0.08, 0.40]	0.02
Price level, 24 m (window units)	−0.20	−0.78	−0.20	[−0.43, 0.02]	0.53

1,000 samples of 369 months generated by the estimated r*-gap model with the FCI (12 lags) as the true process, analysed with the 2-year yield and the FCI measured in nominal form (the r*-gap series plus the actual expected-inflation and r* terms, which do not depend on the policy shock), with the data's calendar and announcement days; proxy VAR with 12 lags. Data: the 1996 sample, 12 lags, in the same form. True: the r*-gap model's response per +1 pp on the monthly-average 2-year yield (ratio of the window response to its contemporaneous monthly-average response), or per +1 pp in the window in panel C. For yes/no rows the last column is the simulated frequency of the event. A data value near the middle of the simulated distribution (share close to 0.5) means the data look like a typical sample from the model.

Table 27: Would a monthly proxy VAR look like the data if the r*-gap model were true? Real measures

Quantity	Data	True	Simulated median	5th–95th	Share ≤ data
A. Proxy VAR without the FCI					
First-stage F	5.2		3.3	[0.1, 13.5]	0.66
Unemployment, 12 m	−0.89	0.72	−0.05	[−1.99, 1.99]	0.14
Unemployment, 12 m: set unbounded	no				0.45
Price level, 24 m	−0.58	−1.70	−0.48	[−3.20, 2.17]	0.44
Price level, 24 m: set unbounded	no				0.45
Unemployment, 12 m: estimate negative	yes				0.54
Unemployment, 12 m: set bounded and below zero	yes				0.07
B. Proxy VAR with the FCI					
First-stage F	2.4		3.2	[0.1, 12.7]	0.40
Unemployment, 12 m	−0.38	0.72	0.18	[−1.58, 2.73]	0.22
Unemployment, 12 m: set unbounded	yes				0.45
Price level, 24 m	−0.87	−1.70	−0.55	[−3.40, 1.85]	0.37
Price level, 24 m: set unbounded	yes				0.45
Impact on the FCI per +1 pp 2-year	0.16	1.04	0.99	[−0.76, 3.32]	0.12
C. Monthly VAR with the window impact					
Unemployment, 12 m (window units)	−0.02	0.33	0.09	[−0.16, 0.38]	0.21
Price level, 24 m (window units)	−0.26	−0.78	−0.28	[−0.55, −0.03]	0.56

1,000 samples of 369 months generated by the estimated r*-gap model with the FCI (12 lags) as the true process, analysed with the 2-year yield and the FCI measured in real form (the r*-gap series plus the actual expected-inflation and r* terms, which do not depend on the policy shock), with the data's calendar and announcement days; proxy VAR with 12 lags. Data: the 1996 sample, 12 lags, in the same form. True: the r*-gap model's response per +1 pp on the monthly-average 2-year yield (ratio of the window response to its contemporaneous monthly-average response), or per +1 pp in the window in panel C. For yes/no rows the last column is the simulated frequency of the event. A data value near the middle of the simulated distribution (share close to 0.5) means the data look like a typical sample from the model.
