Note B: baseline and robustness results

Unemployment and prices after a monetary policy surprise

Working tables (generated by `baseline/make_report.py`)

What the tables show

Each table reports the response of the unemployment gap (percentage points) and of the core PCE price *level* (percent) to a monetary policy surprise that raises the 2-year Treasury yield by 1 percentage point in the announcement window, at 12, 24 and 36 months. Responses are traced through a daily block (the 2-year yield, and the market financial conditions index (FCI) of Note A where included) into a monthly system for the unemployment gap and core PCE inflation, with 3, 6 or 12 monthly lags. In every row the 2-year yield is shown without and with the FCI, and the FCI is in the same form as the rate: nominal, real or r*-gap.

Common specification. Surprises: the Nakamura–Steinsson policy news series, 252 FOMC announcements from January 1996 to July 2026, identified in the announcement window with macro variables held fixed; macro variables first within the month; no deterministic trend in any equation except Robustness 2c–d; sample to September 2026 unless stated. Intervals are 90% bootstrap intervals from 200 draws (residual resampling in the monthly equations and resampling of announcements; the daily block is not re-estimated). A star marks a 90% interval that excludes zero.

Cases. **Baseline**: start February 1994, all data in. **Robustness 1** (sample; r*-gap only): start 1973; March–December 2020 dropped from all equations, start 1994 and 1973; sample ending December 2019, start 1994 and 1973. **Robustness 2** (the r* adjustment and trends; start 1994 and 1973): Kiley's r* used in both the rate and the FCI; and the real 2-year yield with the real FCI and a natural cubic spline trend in place of any r* measure. **Robustness 3** (all data): the excess bond premium (EBP) added as a third monthly variable, r*-gap.

Choices made in building these tables (to be confirmed).

- "Dropping 2020" removes the monthly observations and the daily observations for March through December 2020 from the estimation of every equation. The 2020 values still enter as lagged regressors in the following months, and the 2020 announcements remain among the shocks.
- Robustness 1 has five cases (one start-date change, two drop-2020, two end-2019).
- In Robustness 2a–b the FCI is Note A's index built with Kiley's r*, so rate and FCI use the same adjustment.
- In Robustness 2c–d the spline has knots at the sample ends and at the NBER business-cycle peaks inside the sample (1994 start: 2001, 2007, 2020; 1973 start: 1973, 1980, 1981, 1990, 2001, 2007, 2020), is linear beyond the end knots, and is estimated in every monthly equation (not in the daily block).
- The EBP source file is undocumented [unverified].
- Starts before 1990 use monthly splices for the 2-year yield, expected inflation and the FCI before the daily data begin (FS-A29 in `FS_QA.md`).

1 Baseline

2 Robustness 1: sample (r*-gap only)

3 Robustness 2: Kiley r* and a spline trend

4 Robustness 3: excess bond premium

Table 1: Baseline: 1994 to the present, all data in, no trend

2-year minus expected inflation minus Kiley's r*; the FCI is Note A's index built with Kiley's r* (same adjustment in rate and FCI). Per +1 pp on the 2-year yield. * = 90% interval excludes zero; intervals in brackets. Obs = monthly observations in the equations.

Table 8: Robustness 2b: Kiley r*, start 1973

No r* measure: the trend is a natural cubic spline in time (knots at the sample ends and at the NBER business-cycle peaks inside the sample), estimated in every monthly equation. Per +1 pp on the 2-year yield. * = 90% interval excludes zero; intervals in brackets. Obs = monthly observations in the equations.

Table 10: Robustness 2d: real 2-year and real FCI with a cubic spline trend, start 1973
